

Denitrification & DNRA gene abundance over time — CAN system

Each line is one row of gene abundance figure (the heatmap). Abundance is the community total: per-sample RPKM summed across all 19 MAGs; RPKM is depth-normalised so values are comparable over time. Line colour = N-transformation stage; within a stage the second gene is dashed/square. Multi-gene rows (nar, nap, nirB/D, norC) use the per-MAG max RPKM over the row's genes, as in the heatmap. Log y-axis. Source: data/gene_abundance_over_time.tsv.
